

ENERGY PROCUREMENT at Freie Universität Berlin 2000 – 2014

Between 2000/2001 and 2014 Freie Universität Berlin managed to reduce its energy use by **almost a quarter**, despite increasing its total land area.

The electricity and heat demand in 2014 was **38 million kilowatt-hours** lower than in the reference years 2000/2001.

In comparison to the base situation in 2000/2001, this corresponds to:

- a reduction of the energy consumption by **23.6 %**
- a yearly cost alleviation of **3.8 million Euro**
- a decrease of climate-relevant CO₂ emissions of about **14,900 t**

The electricity price for Freie Universität more than doubled between 2003 and 2013. The price development for 2015 is still unclear. Due to apportionment changes of the EEG levy, electricity prices might fall for the first time since the millenium turn.
